

Posture Assessment

Education & Options

To help guide clients, we provide an in-depth cybersecurity posture assessment that allows us to identify the security solutions currently in place, which ones are used consistently and to what extent. From there, we are able to provide an understanding of potential discrepancies and create a roadmap to help bridge gaps that may not always be visible but are ever present.

Vulnerability Assessment

Affordable Vulnerability Assessment

Vulnerability scanning and assessment is a core strategy needed for any organisation regularly. While we recommend scanning for vulnerabilities every week with regular patching immediately after, not every organisation is there in their cyber maturity journey. Our vulnerability assessment includes raw data from the scanning tool(s) leveraged but also our weighted opinion of the risk involved, including the severity of the risk, the likelihood the risk will occur based on the client environment, and recommendations to remediate those vulnerabilities efficiently.

Penetration Assessment

Validate your security posture

Many clients and partners come to us looking for a penetration test to validate their security posture, highlight gaps, or help enable compliance. No matter what the reasoning is, regular penetration testing is a sound practice to identify security gaps and avoid potential issues that can have a significant impact on your organisation.
